## Section I: Overview of the 1985-2005 Marriage History File

The 1985-2005 Marriage History File is designed to facilitate access to information collected in the 1985 through 2005 waves of the Panel Study of Income Dynamics (PSID) regarding retrospective histories of marriages. This file contains details about marriage events of eligible people living in a PSID family at the time of the interview in any wave between 1985 and 2005. The PSID definition of "eligible" is described in detail below.

Each set of records for a specified individual contains all known cumulative data about the timing and circumstances of his or her marriages up to and including 2005, or those waves during that period when the individual was in a responding family unit. If an individual has never been married, one record indicates that report.

The number of variables are few; they contain relevant identifiers for the individual and his or her spouse, dates of marriages/divorce/widowhood, the order of the specific marriage, total number of marriages and the most recent wave in which data were collected.

The 1985-2005 Marriage History File stores information in an efficient manner that allows a high degree of flexibility in linking with the PSID's Individual File. It is designed to be linked to the 1968-2005 Individual File. Linkages can be done from either the individual's or the spouse's standpoint. These linkages are more limited for spouses than for individuals, since some spouses have never been part of the PSID and hence have no record on the 1968-2005 Individual File.

Data users who want only some of the detail of the marriage data will find marriage history information summarized on Public Release I versions of the PSID Individual files in several individual-level summary variables. These variables include number of marriages, beginning and ending dates for the first and the most recent marriages, marital status of the individual at the time of the most recent interview, and the most recent wave when marriage data were collected. For particulars, see Section VI below.

### Individuals for Whom the Data are Available

The marriage history data were collected about individuals of marriage-eligible age in responding PSID families, i.e., those with values of 1-20 for the "Sequence Number" variable in a given wave. In waves when individuals were nonresponse or in an institution, no information was collected about them. The types of individuals asked for marriage history information and the detail gathered about their history differed over the waves from 1985 through 2005; 1985 followed one pattern, and 1986 through 2005 followed another.

To keep respondent burden to a minimum and data quality high, different question sequences about these events have been used for PSID individuals depending on their circumstances. Marriage history information was gathered as described below:

- (a) in the 1985 wave, a complete retrospective marriage history was asked of a Head, Wife, or "Wife" of any age;
- (b) in all succeeding waves, marriage history was updated for changes

since the beginning of the prior calendar year for a Head, Wife, or "Wife" of any age who was also a Head, Wife, or "Wife" in the prior wave's interview;

- (c) in succeeding waves, details about first and current or most recent marriages were asked for a New Head, New Wife, or New "Wife" of any age; and
- (d) in all waves from 1985 through the present, details about first and current or most recent marriages were asked for an Other Family Unit Member (OFUM) aged 12-44 at the time of the interview.

These latter two groups, although initially asked about only first and last marriages, may have additional marriage records on the file if those marriages occurred while the individual was in a responding family.

A number of complexities in the overall study design present special challenges for collecting and processing the demographic history data:

- (a) In any wave of the PSID some family members appear in the study for the first time, whereas most are people who have been participating for years.
- (b) From one wave to the next a PSID individual can enter or leave eligibility for being asked marital or childbirth histories by passing the threshold ages for these questions. For example, the entry age for eligibility is 12, and for family members other than Head, Wife, or "Wife" the exit threshold for eligibility is 45.
- (c) A PSID individual can change his or her relationship to Head from one wave to the next, and this can affect whether the demographic event-history information is self-reported or proxy-reported by a parent or by some other relative.
- (d) From one wave to the next the range of demographic events asked about a given individual can expand or contract--information about adoptions is gathered for Heads, Wives, and "Wives" but not other family members.
- (e) A PSID individual can become nonresponse, after which time demographic event history information is not updated.
- (f) While both Heads and Wives/"Wives" were interviewed in 1985, only one person (usually the Head) has been the respondent in each year since then.

In the 1990 wave, a sample of 2,043 Latino households was added to the PSID sample to provide the representative information about Latinos that is now available for blacks and non-Latino whites in the original PSID. The Latino sample size was increased to 2,308 households in 1992. This sample was dropped from the PSID in 1996. The marital history data of the Latino sample are also included in this file.

In the 1992 interview, the PSID undertook a pilot effort to recontact former respondents who had attrited from the study and persuade them to

rejoin. Additional information regarding the 1992 recontact samples is discussed in the 1992 PSID Documentation, pp. 1-3; but briefly, four types of recontact samples were identified for inclusion in this round of interviewing. They differed in the detail gathered about their marriage history.

- (a) 1992 Reinterview recontact families were last interviewed during the 1990 wave, but attrited in 1991.
- (b) 1992 Splitoff recontacts were sample members who moved out of a responding 1991 family but who were not interviewed themselves in 1991.
- (c) 1992 Sample recontacts were designated as members of original 1968 Panel families who were last interviewed at some time between 1969 and 1989.
- (d) 1992 Latino recontacts were families in the original Latino National Political Survey sample, but either refused or were never contacted by the PSID during the 1990 wave when the Latino sample was added to the study.

Splitoff, Sample, and Latino recontacts (the last three types described above), like all other New Heads/Wives/"Wives", were asked questions detailing their first and most recent marriages. The marriage history of Reinterview recontacts (the first type above) was updated for changes in 1991 and 1992. Since this latter group of people was interviewed in 1990, but not 1991, information was lost for events occurring between the 1990 interview and January of 1991. The unaccounted-for time varies from a month or two up to a maximum of nine to ten months. Reinterview recontacts can be identified on the cross-year Individual Files by data values of 2 or 3 for "1992 Follow Status" (V30799/ER30799).

In 1993, 1994, and from 1997 onward the PSID also recontacted attriters, but these individuals were asked the same retrospective marriage histories as persons new to the study; that is, reports of their first and current or most recent marriages were sought.

#### Background for the Marriage History Files

The 1985-2005 Marriage History File originated with the 1985 collection of comprehensive, retrospective questions about a number of demographic events, including childbirth, adoption, marriage, separation, divorce and substitute parenting. In each wave from 1986 through the present, these histories, excepting substitute parenting, were updated for eligible individuals.

All the retrospective data collected in 1985 on these demographic phenomena are included in the 1985 Ego-Alter File. This file is mostly of interest for the substitute parenting information and for child-specific information on public program participation and health care surrounding a birth. These sets of questions were discontinued after the initial retrospective in 1985. For more details about the 1985 Ego-Alter File, refer to A Panel Study of Income Dynamics: 1985 Ego-Alter File Documentation.

Beginning in 1986, we decided to release the demographic history data

annually as two separate files: the Childbirth and Adoption History File and the Marriage History File. These files are cumulative, and so their size increases each year as more events happen and additional people become eligible.

#### How to Obtain the File and Whom to Contact About Questions

The 1985-2005 Marriage History File is available through the Internet. The URL (location) of the PSID home page is:

<http://www.psidonline.isr.umich.edu>

If you have questions that are not answered by this documentation, you can contact PSID staff through our website; click on "Contact Us" under "PSID Guide" on our home page.

#### Section II: Questionnaire Detail

The flow of the PSID questionnaire is complex. As described above in Section I, the types of individuals asked for history information and the detail gathered about their history changed.

The analyst may find it helpful to actually see the questionnaires. The 1985 sequence is available in the PDF format version of the main 1985 documentation volume on pp. 23-31 and pp. 58-68, located on our website. The 1986-2005 sequences are identical to each other, with the addition, beginning in 1997, of questions about birth location, race and ethnicity. PDF format versions of the 1991-1996 main questionnaires are also available on our website. They contain the questions for Head/Wife/"Wife" marriage history, but do not include the supplementary forms used for details about childbirth and adoptions, or for OFUMs' marriages and childbirths. These supplements are not available on the website as of this writing. The website also includes Computer-Assisted Interview (CAI) Documentation for 1993 forward, and this version of the PSID interview schedule does incorporate the specifics of the questions asked about each spouse and the questions asked for OFUMs.

#### Section III: Structure of the File

##### Number of Records

The 1985-2005 Marriage History File contains a total of 49,112 records. This file has a one-record-per-marriage general structure. Each record contains information for a specified marriage for an individual, or information that indicates the individual has no marriage data. Information for an individual is current as of the most recent wave that marriage history was collected for him or her.

Multiple records for a given individual result from an individual having more than one marriage. Although the individual remains the same in such circumstances, the spouse differs from one record to the next. The maximum number of marriage records for a given individual is eight on the 1985-2005 Marriage History File. A few multiple records for a given spouse also exist. This occurs when an individual has remarried the same person. In

situations where two individuals were married to each other twice and were both present in a responding family unit, the file contains four records for this pair, two records for each of the two individuals.

#### Sort Order of the File

The 1985-2005 Marriage History File is sorted, in ascending order, by "1968 Interview Number of Individual" (MH1), "Person Number of Individual" (MH2), and "Order of This Marriage" (MH8). Details for an individual's first marriage are followed by those for his or her second, third, etc., or the most recent marriage. As noted in Section I, complete marriage histories were gathered for Heads, Wives and "Wives" in 1985, but information on only first and most recent marriages was initially collected for New Heads, Wives, and "Wives" in 1986 through 2005 and OFUMs in any wave from 1985 forward.

All records for the first eligible member of a 1968 PSID family are followed by those for the next eligible member in the same family of origin. When all of the records for all eligible members in the first family are exhausted, records for eligible members in the second family follow.

#### Variables on the File

The 1985-2005 Marriage History File contains twenty variables, which can be categorized into those relevant to the individual, those specific to his or her spouse, those in regard to the marriage in question, and some aggregate information about the marriage history for the individual.

#### Information specific to the individual:

MH1	1968 Interview Number of Individual
MH2	Person Number of Individual
MH3	Sex of Individual
MH4	Month Individual Born
MH5	Year Individual Born

#### Information specific to the spouse:

MH6	1968 Interview Number of Spouse
MH7	Person Number of Spouse

#### Information specific to the marriage:

MH8	Order of This Marriage
MH9	Month Married
MH10	Year Married
MH11	Status of This Marriage
MH12	Month Widowed or Divorced
MH13	Year Widowed or Divorced
MH14	Month Separated
MH15	Year Separated

#### Aggregate Information for the marriage history of this individual:

MH16 Year Most Recently Reported Marriage  
MH17 Number of Marriages of This Individual  
MH18 Last Known Marital Status  
MH19 Number of Marriage Records  
MH20 Release Number

#### Section IV: Idiosyncrasies, File Cleaning and Variable Detail

Several aspects of the 1985-2005 Marriage History File merit particular attention. This section discusses what they are and how to handle them.

##### How to Identify Individuals Who Were Never Married

One caution, particularly relevant to event-history analysis, concerns the records for individuals who have never married. The file has one record for each such person. On these records, the "Number of Marriages" variable (MH17) has a value of zero. Codes indicating "Inapplicable" (9s) are padded in the fields for marriage details, with the exception of Spouse ID (MH6) and Spouse Person Number (MH7); both of these variables have values of zero.

##### How to Identify Individuals For Whom No Marriage Data Were Ascertained

Persons who may or may not have married but for whom the PSID has been unable to determine anything relating to his or her marriage situation, not even marital status, also have one record on this file. On this type of record, the "Number of Marriages" variable (MH17) has a value of 98, although this value is not unique to such individuals. Missing data codes (8s or 98s) are padded in all the fields for that record, with the exception of Spouse 1968 ID (MH6) and Spouse Person Number (MH7). These two variables contain values of 9s, which do uniquely identify this sort of record.

##### Treatment of Individuals Who Become Nonresponse

The Marriage History File is cumulative; that is, all individuals who have ever been eligible for the marriage history question sequences since it was first begun in 1985 have at least one record on the file. Thus, each new version is current through the most recent wave for individuals in responding families, but the data are up to date only through the last year that nonresponse individuals were living in a responding family.

The marriage history is current through 2005 for those in a responding PSID family at the time of the 2005 interview and who are otherwise eligible for marriage history questions. For those who were nonresponse in the 2005 wave or who are no longer eligible for the questions, the history is current through the last year they were in an interviewed family unit and eligible. For example, if an individual became nonresponse for the 1988 wave and has not returned to a PSID family, his or her marriage history is current only through 1987. Similarly, if an OFUM who has remained in a responding family is now 47 years old, his or her marriage history has not been updated in the last few waves, since OFUMs' marriage information is not collected once they achieve 45 years of age. The variable indicating recency of an individual's marriage reports is MH16.

## Idiosyncrasies, Data Cleaning and Treatment of Incomplete or Inconsistent Information

We have tried very hard to assure access to all available information while also recording occurrences of missing data or unclear identification of spouses. In some situations, the individual was reported to have married, i.e., his or her marital status is known to be divorced, widowed, separated, or currently married, but details about the marriage or the identification of the spouse were not reported. PSID staff can and do assign an identifier to such a spouse, as it is clear that the spouse has never been part of the study.

Often the same event (e.g., a divorce) is reported in more than one successive interview. In such cases, the initial report is chosen as the source for the associated date of the event (e.g., month and year of a divorce) unless the date was not ascertained. In that event, the succeeding year's reported date was used on the principle that known dates are better than missing dates.

Individuals from whom we have reports of their marriages to each other may disagree on the status. This seeming inconsistency can be legitimate if the currentness of the spouses' reports differs. The variable indicating the wave in which the marriage history was most recently updated is MH16. As an example, in 1990 a female sample member marries, and her new husband-head moves into the study. In that wave we receive reports of their mutual marriage, and each of them has a record on the Marriage History File registering the other as spouse. They each receive values of 1990 for MH16. In each successive wave their marriage is reconfirmed, and values for MH16 are updated until 1994, when they separate and divorce. He, the non-sample husband and former head, leaves the PSID but the sample wife remains response. The record for her marriage to him is updated to indicate the revised status, the dates of separation and divorce are added, and MH16 receives a value of 1994. But his record is not updated; his status remains married, and MH16 retains a value of 1993.

The preparation of the 1985-2005 file involved a great effort to eliminate real inconsistencies. If a couple no longer living together disagreed on their marital status but both were responding at the same time, PSID staff attempted to reconcile the differences. Marriage and birth dates were cross-checked to ensure that marriages do not occur until an individual is at least 13 years old. Eleven marriages remain in which the individual reports a start date before that age. We are unable to resolve these cases. In most of them, marriage at age 11 or 12 is possible. Five of these persons are females from the 1990 Latino sample, and two are from the 1997 immigrant sample. For the latter, subsequent birth date information may clarify matters.

On a related note, an individual's birth date is copied from the current wave of the Individual File when his or her marriages first appear on the cumulative Marriage History File. This birth date is not updated in later years for the initial record(s). If a new marriage subsequently occurs for the individual, then his or her birth date from that later wave is used in the construction of the new record. Thus, birth dates for the same individual may disagree across marriages if the reports were not collected in the same wave. These discrepancies were cleaned to some extent, but

only as a by-product of other cleaning activities.

Attempting birth date consistency is made difficult because of individuals' varying years of participation in the study. In the longer term, we hope to clean these dates, but for the present we advise analysts to use the individual's birth date or age variables from the most recent year of Individual File data for which he or she is present in the study.

We checked the internal consistency of marriage dates: termination dates must not precede marriage dates, and an earlier marriage must end by the time a later marriage begins. All cases in which divorce dates preceded separation dates were checked for coding/data entry errors and against corroborating sources (e.g., if the spouse had ever been in the study, his or her date of move out was compared to the separation date). In 114 cases, indeed the couples did not separate until after their divorces were finalized.

In 31 cases, we were unable to resolve the final status of a person's earlier marriage. These individuals appear to be bigamists, and probably are. The earlier marriage records have values of 7 for the status variable (MH11).

Yearly fluctuations in status were reconciled as information from each successive wave was incorporated. For example, divorcees have been known to report themselves as widowed after their ex-spouses' deaths; their statuses were recoded to divorced. Individuals who separate and then resume living together were recoded as married. The fact of their former separation must of necessity disappear from the file. Interruptions of this sort can be found by comparing the couple's data records on the cross-year individual file for co-residence; that is, comparing their yearly family interview numbers and sequence numbers (e.g., for 1990, V30642/ER30642 and V30643/ER30643). And every attempt was made to reconcile differing reports of status between couples if they were present in the same wave.

Spouse identifiers were checked against cross-year individual data and against the 1985-2005 Childbirth and Adoption History File to ensure that no spurious cases of intergenerational incest occur. If both spouses had been in the study, their genders from the cross-year individual file were checked against each other.

Our final checks assured that all individuals who had ever qualified for marriage history questions had records on the file, and that individuals who had never qualified did not.

#### Who has Cross-Year Information

Please keep in mind another PSID intricacy when matching across files: while all individuals were present in a PSID family, many spouses identified in the marriage histories have never been present in a PSID family unit during the years the study has been in progress; these spouses have values for "Person Number of Spouse" (MH7) in the range 900-990. Consequently, each individual has been in a PSID family unit and has a record on the 1968-2005 Individual File, but his or her spouse may or may not.

## What Cross-Year File to Use for Merging

The 1985-2005 Marriage History File matches the 1968-2005 Public Release I Individual File exactly. If you attempt to merge the 1985-2005 Marriage History File with earlier individual data releases, some cases on the merged file will NOT match and may result in the assignment of some erroneous spousal relationships! See the next section for details.

## Marriage Order

As described in Section I, in the initial wave of demographic event history collection in 1985, all Heads, Wives and "Wives" were asked to provide details about all of their marriages. But in subsequent waves, the retrospective marriage history questions for new Heads, Wives and "Wives" permitted detailed information about only two marriages, the first and the current or most recent. OFUMs were never asked about all their marriages; even in 1985 we requested reports about only the first and current or most recent. Even so, the Marriage History File contains complete histories for most individuals, since more than two marriages is a relatively rare event. The number of individuals reporting more than two marriages is 3315; 2292 of them have reported all their marriages, but 1023 have not.

The order of each marriage for an individual is indicated in MH8; values are assigned to each marriage in chronological order. The 1023 individuals for whom we have received incomplete reports have gaps in the values for marriage order across their records. For example, if a person has been married three times but we have received detailed information about only the first and last marriages, the first marriage is assigned a value of 1 and the last marriage receives a value of 3. No record for marriage number 2 is on the file. These individuals can easily be identified, as values for the number of their marriages (MH17) are greater than values for the number of their records (MH19), of course excluding cases where the number of marriages contains missing data.

The relative order of marriages is always clear because of the way in which the questions are asked and updated. A missing beginning date for a marriage does not cause its order to be unknown. However, 275 individuals have a marriage of unknown order. This has happened in two different circumstances. If the interviewer did not obtain a complete marriage history when the individual entered the study but he or she was known then to be or have been married, we created a record for that current or most recent marriage with the information available. This situation accounts for the overwhelming majority of the cases (272). These persons have a known spouse at MH6-MH7, a known marital status at MH11, but the number of their marriages is not ascertained (MH17=98) and the number of records for them (MH19) equals 1.

The second, much rarer, circumstance in which a marriage is known to have taken place but its order is not ascertained occurs when the total number of marriages is not ascertained, but the person reports a first and a last. Only three individuals on the file fit this profile. Their first marriage receives an order value of 1, of course, but the last must of necessity have a value of 98. At least through the 2005 wave, however, no person has more than one marriage with order unknown.

## Section V: Linking Records

### Using the Marriage History File in Conjunction with the Cross-year Individual File

The Marriage History File is designed to be linked to PSID Individual data for analysis purposes. The Marriage History File has only a modest amount of information about the individual and his or her spouse(s). The analyst will no doubt want to access the much greater volume of data available for these individuals on the Family and Individual Files. Those files can provide abundant information for many individuals dating back to 1968 when the PSID began, although for some the span of available data is more limited or nonexistent.

When matching the 1985-2005 Marriage History File to individual data, only the 1968-2005 Individual File should be used. During file merging, a number of unique individual identifiers were corrected. Special care was taken to ensure perfect correspondence in individual identifiers between this file, the 1985-2005 Childbirth and Adoption History File, and Public Release I of the 1968-2005 Individual File.

Because of the corrections, do not attempt to match this file with any other PSID data file or a subset derived therefrom using these unique individual identifiers. Nonmatches in individual records definitely will occur if any other file besides the above-named is used.

Data processing is required to link records between these two files. To achieve linkages, one must match on the unique individual-specific identifier. This unique identifier is a combination of two variables: "1968 Family Interview Number" (MH1) and "Person Number" (MH2). The corresponding variables for this unique identifier on the cross-year Individual File are V30001 and V30002 (or ER30001 and ER30002). Care must be taken with regard to the proper files to use, the choice of individuals on the Marriage History File for whom matches are attempted, and the years for which data are available.

Individuals and spouses vary substantially in terms of which years they have been present in PSID family units over the course of the study. This affects the availability of data for them on the main files because valid information is obtainable on those files only in the years that the individual is present in a PSID family unit ("present" means living in the family unit or having left it to enter an institution). For more details about PSID tracking procedures and classification of people into family units, see the discussion in Section 8 on "Family Composition and Change", p. 55, in *A PANEL STUDY OF INCOME DYNAMICS: A USER'S GUIDE*, by Martha Hill (Sage Publications, 1992). First there is the matter of whether any record exists for an individual. If a record does exist, then the question is in which years of the study are data available for that individual and his or her family.

If a person, either individual or spouse, has a record on the 1968-2005 Individual File but less than the full range (34 waves) of data in that record, variables in the waves when he or she was not present in a PSID family unit are, for the most part, filled with zeros. In addition, the annual individual-level variable "Type of Individual Data Record" in those

years indicates that he or she is nonresponse.

As noted among the cautions in Section IV, all eligible individuals have records on the 1985-2005 Individual File because they were present in a PSID family unit during that time period. However, many spouses do not have records on that file, since indeed they have never been in a PSID family at any time during the course of the study. Spouses who have been present in a PSID family unit at some time since the study began have records on the 1985-2005 Individual File. Values for their Person Numbers are in the range 001-399. Spouses who have never been present have Person Number values in the range 900-990.

Even though all individuals have records on the 1968-2005 Individual File, that file does not necessarily contain data for all of them for all years of the study. Some of them first entered the study in, e.g., 1985, and thus only have data since that year. Others have logged more than 30 years of inclusion in the study. Similarly, there is considerable variation among spouses regarding which years, if any, they were included in the study.

For those persons with records on both the Individual File and the Marriage History File, linkages rely on a match of individual-specific identifier variables that appear on both files. As noted earlier, the unique identifier involves two variables: "1968 Family Interview Number" and "Person Number". The corresponding set of variables on the two files must match to properly link an individual's records from the two sources. The variable names for these two variables are V30001 and V30002 (or ER30001 and ER30002) on the Individual File. On the Marriage History File, they are MH1 and MH2, respectively, for the person designated "individual" and MH6 and MH7 for the person designated "spouse". Note that such linkages involve a one-to-many-match. One record on the Individual File may have more than one matching record on the Marriage History File because the specified individual has multiple marriages.

#### Using the Marriage History File with Other Demographic History Files

Some analysts may be interested in linking information from different records on the Marriage History File, or linking information from records on different demographic files. For example, access to both marriage and childbirth records for an individual are needed to determine, via comparisons of marriage and childbirth dates, the number of biological children an individual has when he or she remarries.

To make links such as these, one must match on the unique individual-specific identifier, which is a combination of two variables -- "1968 Family Interview Number" and "Person Number" (MH1 and MH2 for the person designated as the individual on the 1985-2005 Marriage History File; MH2 and MH3 for the person designated as the parent on the 1985-2005 Childbirth and Adoption History File).

#### Section VI: Marriage Information Available on Individual Files

Some of the information provided on Marriage History Files is also available on Public Release I versions of the cross-year Individual File. In

addition, the Individual File contains some detail relating to marriage issues that the Marriage History File does not.

The following listing shows all of the marriage history related variables included in Public Release I versions of the cross-year Individual File. All are individual-level variables.

ER32033		Year Marital Info Most Recently Updated
ER32034		# Marriages of This Individual
ER32035	ER32036	Month and Year First/Only Marriage Began
ER32037		Status of First/Only Marriage
ER32038	ER32039	Month and Year First/Only Marriage Ended
ER32040	ER32041	Month and Year Separated First/Only Marriage
ER32042	ER32043	Month and Year Most Recent Marriage Began
ER32044		Status of Most Recent Marriage
ER32045	ER32046	Month and Year Most Recent Marriage Ended
ER32047	ER32048	Month and Year Separated Most Recent Marriage
ER32049		Last Known Marital Status

These variables are compiled from marriage history information collected from the 1985 wave through the most current wave of Public Release I individual information included on the file.

#### Section VII: Codebook

The item-by-item descriptions for all of the variables in the Marriage History File follow. Unweighted frequencies were calculated for each variable.
