PSID SAMPLE: AMERICA’S FAMILY TREE

The original PSID sample of roughly 18,000 people in 5,000 households consisted of a nationally representative sample and an oversample of low-income families. The oversample was included to facilitate investigations of poverty-related issues. PSID data include economic, social, and health information collected using in-person, telephone, and computer-assisted interviewing methods. PSID families are followed regardless of where they live. The sample grows naturally as children and grandchildren from these families form their own households and are invited to join the PSID. Samples of immigrants have been added to the PSID in 1997/1999 and 2017 so that the sample continues to closely resemble the national population, making PSID America’s Family Tree.

CONTENT OF CURRENT QUESTIONNAIRE

- Employment
- Wages & Income
- Expenditures
- Wealth
- Mortgage Distress & Foreclosures
- Pensions
- Philanthropy
- Time Use
- Education
- Marriage & Fertility
- Health Status
- Health Behaviors
- Health Insurance
- Program Participation
- Computer Use & Technology
- Housing Characteristics

STUDY DIRECTION AND OVERSIGHT

PSID is directed by faculty at the University of Michigan, with data collection conducted by the Survey Research Operations group within the Survey Research Center at the University of Michigan Institute for Social Research. An external Board of Overseers, comprised of leading scientists from various disciplines, provides scientific input to the project.

SPONSORSHIP

Major sponsorship of the PSID is provided by: the National Science Foundation, the National Institute on Aging, the Eunice Kennedy Shriver National Institute on Child Health and Human Development, the Center on Philanthropy at Indiana University, and the United States Department of Agriculture.

DATA ACCESS: PSID.org

All waves of the PSID and study supplements are accessible via the PSID Data Center, which provides:

- Automatic merges of all waves of data from the PSID and its major supplements
- Customized codebooks and datasets in a variety of formats including SAS, Stata, SPSS, Excel, and text
- Instructional web tutorials, bibliographies, technical papers, and user documentation

Some types of PSID data are available only under a restricted contract. These include but are not limited to: geospatial data below the level of state; mortality data from the National Death Index; assisted housing data from the U.S. Department of Housing and Urban Development; Medicare claims; and educational characteristics from the National Center for Education Statistics.
PSID OVERVIEW

The PSID is the world’s longest running nationally representative household panel survey. With nearly 50 years of data on the same families and their descendants, the PSID is a cornerstone of the data infrastructure for empirically based social science research in the U.S. PSID gathers data on the family as a whole and on individuals residing within the family, emphasizing the dynamic and interactive aspects of family economics, demography, and health. PSID data were collected annually from 1968-1997 and biennially after 1997.

With low attrition and high success in following young adults as they form their own families, the sample size has grown from roughly 5,000 families in 1968 to more than 10,000 families and 24,000 individuals by 2017. The PSID has distributed data on more than 75,000 individuals over the course of the study.

DATA ON CHILDREN AND YOUNG ADULTS

The Child Development Supplement (CDS) collects extensive data on children and adolescents and their primary caregivers in PSID families. The first cohort of the CDS was launched in 1997 and observed children every five years across three waves from 1997 to 2007 in order to study the dynamic process of early life human and social capital acquisition.

Starting in 2014, CDS began following a new cohort of children, conducting interviews with all eligible children in PSID families born or adopted since 1997 and their primary caregivers. The study design and questionnaire content are consistent with earlier waves of the CDS to permit cross-cohort analysis of children’s development. New study features include:

• Coverage of all eligible children in PSID families in the full age range (birth to 17 years)

Once children from CDS reach age 18 they are followed in the Transition into Adulthood Supplement (TAS), which started in 2005 and collects data biennially. The study captures data on developmental pathways and outcomes during the transition from childhood through young adulthood. Beginning in 2017, all young adults age 18-28 will be eligible for TAS, regardless of their participation in CDS.

DATA ON HEALTH AND AGING

The PSID has gathered rich information in the domains of health, wealth, and pensions. These data can be used in combination with panel data on employment, income, race, and education, which in some cases is available over almost the entire life course.

Data collected on health includes health status, onset and recency of health conditions, health behaviors such as alcohol use, smoking, and exercise, BMI, health insurance, and expenditures. Information about mental health was collected starting in 2001. A health history calendar was implemented starting in 2007 to collect information on early childhood health conditions, including age of onset and duration.

DISABILITY AND USE OF TIME

Supplemental data collections (DUST) were conducted in 2009 and 2013 to investigate the connections among disability, time use, and well-being of older adults.

Information was obtained about:

• What respondents did and with whom
• Where they were during activities
• How they felt
• For whom the activities were carried out (household and care-related activities)

GENERATIONAL AND LIFE COURSE DATA

The long panel, genealogical design, and broad content of PSID data offer unique opportunities to conduct generational and life course research. The PSID now contains thousands of inter- and intragenerational relationships over nearly 50 years of data, including:

• “Paired” generational relationships, with each family in the pair providing independent interviews (as of 2013 wave)
  • Parent-Adult Child pairs: ~5,000
  • Sibling pairs: ~3,600
  • Cousin pairs: ~4,500
• “Tripled” generational relationships, with all three generations providing independent interviews (as of 2013 wave)
  • Grandparent-Parent-Adult Child triplets: ~1,300

The Family Identification Mapping System (FIMS) tool facilitates genealogical analysis by automatically creating a customized file containing identification variables of PSID sample members’ relatives including biological and adoptive children, parents, grandparents, great-grandparents, and siblings.
